Automation

Extreme

Meditec

»Safe switchgear for demanding and critical applications«. True to this motto, steute has been providing its customers with innovative, practical and durable switchgear solutions – for over 50 years.

When our customers are successful, so are we. Because we always focus on our customers, our company has grown steadily and sustainably over the last decades. Steute is committed to continuing this growth – in close cooperation with our customers.

We are situated in East Westphalia, a key region for machine building and electrical goods manufacturing. It is home to qualified specialists committed to developing and manufacturing innovative products. It is also the location of renowned universities, research and educational institutions to which we maintain healthy contacts.

Markets are no longer restricted by national borders. This is why our products are developed and tested for extreme conditions all over the world. We take care to ensure that our products are always certified according to the latest international standards. In every industrial or emerging nation in the world, steute has access to qualified specialists who can guarantee competent support and a quick service.

As a medium-sized company we are able to react with speed to customer wishes and market trends. We are continually developing innovative products and using new technologies as we consistently open up new fields of application for our switchgear.

steute is currently active in four different business fields, producing switchgear, sensors and control units for use in industry and in medical equipment:

Wireless

Cable free switchgear and sensors for use in machinery and process plants. These industrial-strength wireless switches communicate with higher level control systems via reliable radio transmission. »Energy harvesting« can play a major role in these products.

Automation

Standard and customised switchgear for machinery and process plants. Tried and tested electromechanical and non-contact technologies for classical applications in industrial automation and process control – always with a view to the latest global requirements.

Extreme

Switchgear and sensors for use in extreme environments or under extreme conditions. Certified products for use in hazardous areas worldwide (e. g. ATEX, IECEx, GOST).

Meditec

A comprehensive range of standard and customised foot and hand controls for medical devices, meeting the highest ergonomic and availability requirements. Produced in accordance with the certified EN ISO 13485 quality management system for medical products.

The following information provides an overview of our standard range of switchgear for complex and demanding applications. We will be happy to provide you with any additional information you require. If you cannot find the solution for your application: just get in touch. We have already helped numerous customers by developing »tailor-made« switchgear for their individual needs.

Emergency pull-wire switches

Application

Emergency pull-wire switches are of great importance for the man-machine interface in the area of industrial applications. They are, for example, applied on transport and conveyor systems. After manual actuation, work and functional processes are initiated or switched off.

When the new harmonised European standard EN ISO 13850 concerning functional aspects and design guidelines for emergency-stop devices has come into effect, new requirements must have to be met by these command devices. All emergency pull-wire switches described in this chapter meet the requirements of this standard.

Design and mode of operation

On emergency pull-wire switches the emergency-stop command can be initiated from any point along the pull-wire. They have a positive linkage between the NC contacts and the pull-wire. The emergency pull-wire switches are brought into the operational condition

by pre-tensioning the pull-wire, i.e. the NC contacts are then closed and the NO contacts are open. All devices are equipped with wire-breakage detection. In the chapter accessories of the appendix the required accessories for installation are presented.

Emergency pull-wire switches without mechanical latching VD or VS do not conform to the EN ISO 13850. It is possible to meet the requirements of this standard by suitable measurement of the circuitry and control technology.

There are devices with one- and two-side actuation. The wire length, the number of contacts and the mounting position, in the middle or on one side of the system, are the main features when selecting an emergency pull-wire switch.

All emergency pull-wire switches bear the CE mark according to the Machinery Directive 2006/42/EC.

Application

Mounting at head level

Mounting at hand level

Mounting at foot level

Complete fencing

Emergency pull-wire switches

// Technical information

Function principle

All emergency pull-wire switches from steute are provided with a wire-break detection so that the wire must be mounted with a defined pre-tension force. This value of the pre-tension force varies depending on the different devices. The appropriate value can be found on the data sheet of the emergency pull-wire switch. With an incorrect mounting cannot be taken in operation, i. e. an unlocking is not possible. By vertically pulling the pull-wire the switching function is carried out. The actuating force is exclusively depending on the spring rate of the reset spring. There are emergency pull-wire switches with one-side and two-side actuation, see drawings below. Emergency pull-wire switches with two-side actuation must always be mounted with two compensation springs. According to EN 60947-5-5 the maximum values of the actuating force $F = 200 \text{ N}$ and of the actuating travel $s = 400 \text{ mm}$ must not be exceeded on vertical actuation of the emergency pull-wire switch. In addition, the pull-wire must withstand the 10 times higher vertical pulling force that is required in order to generate the emergency-stop signal.

Maximum pull-wire length

The maximum pull-wire length is mainly limited by two basic conditions. On the one hand by the maximum admissible actuating travel s of 400 mm and on the other hand by the thermal change in length of the pull-wire with a fluctuating ambient temperature that may not lead to an undesired actuation of the switch. Because the first basic condition requires a preferably low and the second requires a preferably high elasticity of the system it is necessary to optimise such systems in respect to both basic conditions depending on the operational conditions. In addition, it must be checked if the actuating force F of 200 N is adhered.

Application of compensation springs / Travel limitation

Compensation springs are applied to compensate thermal changes in lengths of the pull-wire and therefore allow for higher pull-wire lengths. In general the following is valid:

- Soft compensation spring with a low spring rate can compensate higher thermal changes in length.
- Though on pull-wire actuation soft compensation springs have a high expansion behaviour and therefore earlier reach the limit of the maximum actuating travel $s = 400 \text{ mm}$. Thus the expansion behaviour limitates the maximum pull-wire length at a constant temperature range or the temperature range at a constant pull-wire length.
- The dimensioning of the compensation spring is determined by the reset spring of the switches (Value of the pre-tension force and

Interrelation of actuating travel / distance wire support

Mounting of one-side actuation

Compensation spring with travel limitation

Mounting of two-side actuation

Emergency pull-wire switches

// Technical information

Examples of other compensation springs variants

spring rate of the rest spring), the pull-wire length (length and elasticity of the pull-wire) and the maximum actuating travel of $s = 400 \text{ mm}$.

- With two-side actuation a travel limitation must be installed, see drawing left page, in order to prevent overstretching of the tension spring
- Before mounting the pull-wire, the red PVC sheath must be removed from the pull-wire in the clamping range of the pull-wire!

An overstress of the compensation spring is in general prevented by a travel limitation. In practice either additional travel limitations are applied or self-protecting compensation springs are used. Additional travel limitations made of catch-ropes are critical when the function relevant length of the travel limitation is set but have a clear advantage in cost in comparison to compensation springs.

Wire thimble deformation

Distance of wire support

The actuating travel required to vertically actuate the switch results from the sum of the spring travels of the switch, pull-wire and where required compensation spring as well as the distance of the wire supports $x \text{ [m]}$. This means a larger actuating travel is required with a larger distance of the wire supports when actuating the pull-wire in order to achieve the same actuating distance. Securing a safe switching at a constant pull-wire length the distance of the wire supports must be reduced in order to aim for a wider temperature range.

Type of pull-wire

The expansion behaviour of the pull-wire is determined by the type of wire. Besides elastic elongation permanent elongations can occur when actuating the pull-wire. Under certain conditions higher pre-tension forces can lead to relaxation processes (temporal pre-tension loss). Statistical spread of the manufacturing process also have an effect on the expansion behaviour.

Therefore it is urgently recommended at least for longer pull-wire lengths to apply pull-wires from steute. These are much tougher and thus optimised for such applications.

Pull-wires from other manufacturers often lengthen gradually because of the creep characteristics of the plastic core (relaxation). If so, it is necessary to regularly check the pull-wire tension and if required to retension the pull-wire. The appropriate security note in the mounting and wiring instructions and the standard application of a tensioner are the prerequisite for a safe function.

Mounting notes

- After fitting the wire, pull strongly on it several times, as the pull-wire and the wire thimble will deform.
- Subsequently, retense the wire using the wire clamp, eye-bolt or tensioner.
- In order to guarantee safe operation, observe the enclosed mounting and wiring instructions.
- According to EN ISO 13850, pulleys may only be mounted such that the complete length of the pull-wire can be observed.

Emergency pull-wire switches

// Pre-stress and actuating forces

Notes

- The values are indicated for an ambient temperature of 20 °C at the stated wire length.
- The linear expansion of the wire due to strain and deformation of the wire thimble is not considered.
- The actuating forces are only approximate values, due to the spring forces being subject to tolerances.

Belt-alignment switches

Application

Belt-alignment switches are suitable for applications with handling equipment. Here they are installed e.g. at both sides of a conveyor belt in order to monitor the misalignment of the belt.

Belt misalignment, evoked by for example not in the middle of conveyor belt positioned goods or pollution of track idlers and deflection pulleys, can lead without any monitoring measurements to damage, destruction, material covering and dropping.

Design and mode of operation

Belt-alignment switches are actuated when the conveyor belt becomes misaligned. Depending on the plant arrangements, this signal can either be used to switch the equipment off or to provide automatic correction of the belt alignment. Thus they should be installed at both sides of the conveyor belt close to the deflection and drive pulleys. In case of very long conveyor systems further belt-alignment switches must be installed. Those are actuated with the misalignment of the conveyor belt. This signal can either switch the system off or start an automatic belt position correction, as well as at the same time generate an optical or acoustic indicating or warning signal.

All belt-alignment switches have positive break NC contacts and those of series ZS also have a mechanical latching. At actuation the NC contacts are opened and latched mechanically. The release can either be carried by push button or key. Thus an unintentional, automatic restart of the conveyor belt is prevented.

All belt-alignment switches bear the CE mark according to the Machinery Directive 2006/42/EC.

Application

Monitoring an conveyor belt

Pull-wire switches

Application

Pull-wire switches are suitable as transducers for starting machines or to open and close electrically-powered doors, gates and barriers.

Design and mode of operation

Pull-wire switches are actuated manually by pulling. There are variants with and without latching. The pull-wire switches without latching generate a switching impulse on actuation. With the devices with latching the switching impulse is maintained until repeated actuation.

An important feature for the selection of pull-wire switches are the mounting possibilities, wall or ceiling mounting. For your support you find a selection table on the following page.

In the appendix the mounting accessories for pull-wire switches can be selected.

All pull-wire switches presented in this chapter bear the CE mark according to the Low Voltage Directive 06/95/EC.

Application

Wall mounting as door opener

Ceiling mounting

ES 41 DB

Slack-wire switches

Application

Slack-wire switches are suitable for applications with handling equipment. There they are for example mounted at a wire in order to monitor the wire tension.

Design and mode of operation

Slack-wire switches monitor the pull-wire tension. With correct tension present, the switch is actuated. In case of wire breakage or stretching of the wire the switch is released and thus switches the system off. In addition, this signal can depending on the construction of the system generate an optical or acoustic indicating or warning signal.

All slack-wire switches presented in this chapter bear the CE mark according to the Low Voltage Directive 06/95/EC.

Wire thimble - Per DIN 6899 - For pull-wire with steel core Ø 3 mm - Wire clamp made of stainless steel available		Wire thimble 3 mm Wire thimble 3 mm stainless steel	1033245 1172707
Eye bolt incl. nut - Per DIN 444 - Available made of stainless steel - Ordering unit: 1 piece		Eye bolt M8x70 with nut Eye bolt M8 x 70 stainless steel with nut Eye bolt BM10 x 40 with nut Eye bolt M10 x 55 open with 2 nuts	1170601 1189687 1032610 1279170
Compensation spring/travel limitation - Adaption of length expansions caused by changes in temperature - Stainless steel 1.4310 - Ordering unit: 1 piece		Compensation spring ZS 71-100N Compensation spring ZS 73/75-200N Compensation spring ZS 73/75-400N Compensation spring ZS 73/75 S Compensation spring ZS 80	1187921 1187931 1187934 1187935 1187933
Compensation spring ZS 91 S - Adaption of length expansions caused by changes in temperature - Stainless steel 1.4310 - Ordering unit: 1 piece		Compensation spring ZS 91 S	1184540
Tensioner M6 - For precise adjustment of pull-wire pre-stress - Per DIN 1480 - Adjustable von 145 mm bis 225 mm		Tensioner M6	1033254
Tensioner M8 - For precise adjustment of pull-wire pre-stress - Made of stainless steel, adjustable from 160 mm to 255 mm		Tensioner M8 Niro	1033300
Cable tensioner system TS 65 - For pull-wire with steel core Ø 4 - 6 mm incl. sheath - Adjustment range max. 65 mm - Diameter of eyebolt min. 8 mm - Pull-wire length max. 75 m		Cable tensioner system TS 65	1186621

Explanation of symbols

- positive break NC contacts
- positive break travel/angle
- latching point
- wire breakage detection
- wire pull detection
- spanner size across flats
- CSA/UL approval, Canada

- CCC approval, China
- Gost approval, Russia

- Inmetro approval, Brazil
- TÜV prototype-tested
- BG prototype-tested

conformity to standards, see declaration of conformity

- I_e thermal test current
- I_{the} Thermal test current
- U_e rated operating voltage
- U_i rated insulation voltage
- U_{imp} rated impulse withstand voltage

Explanation of travel diagrams
